

My Reflection

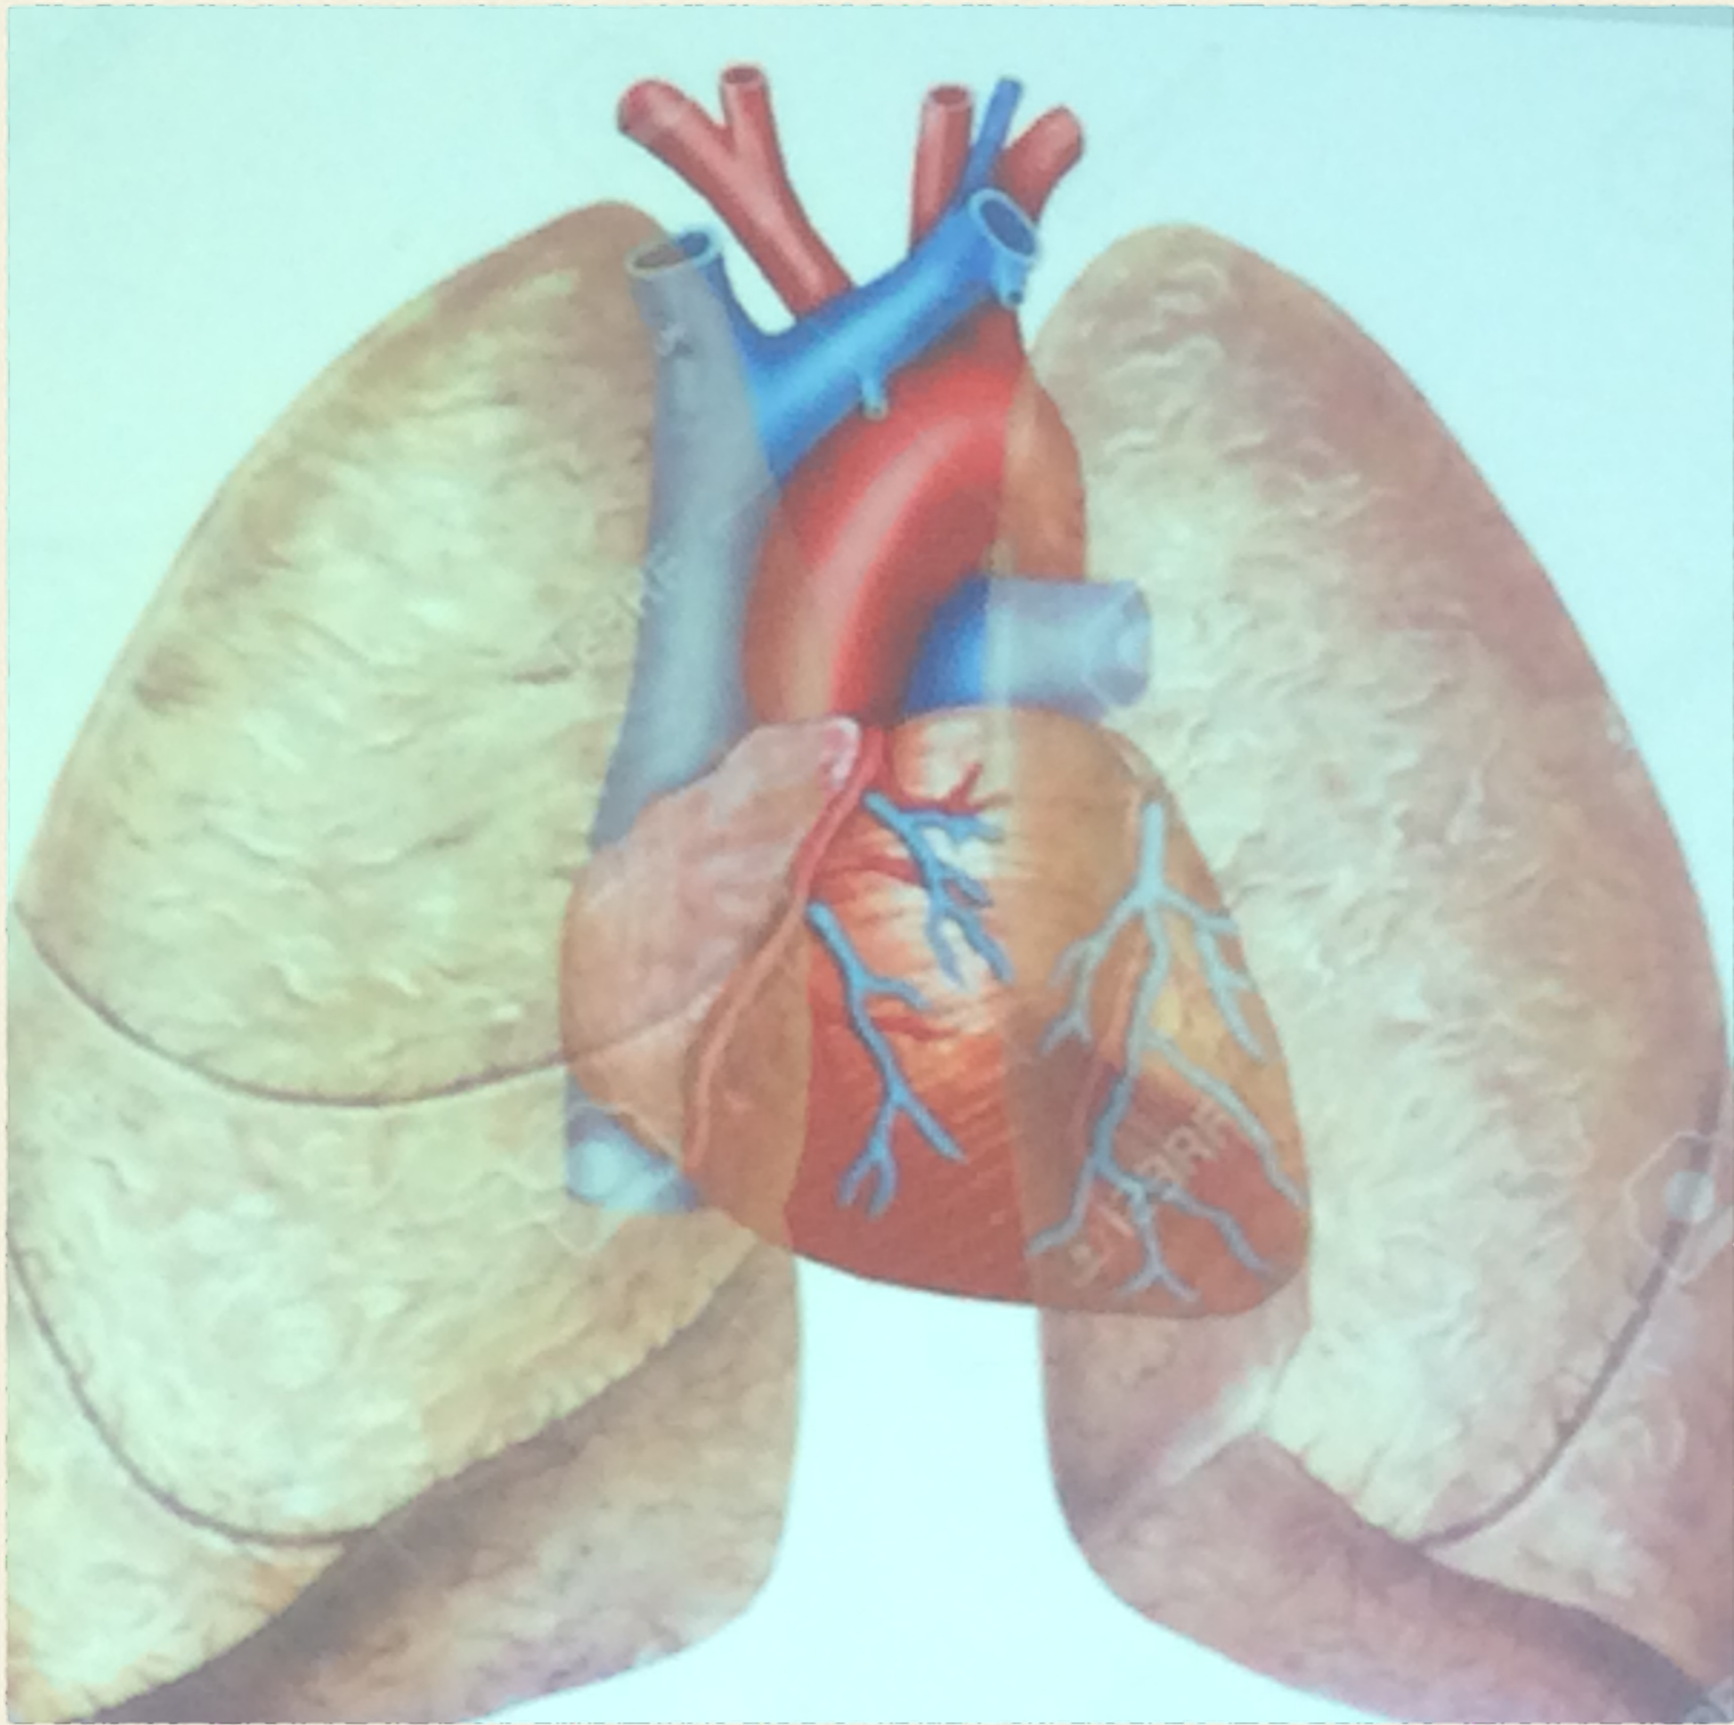

By:Faye

Respiratory System

* Our respiratory system start with our mouth,then it go down to the trachea and to the bronchi.

At the bronchi it goes to our lungs then go to the gas exchange with the alveoli.

After the gas exchange it goes to the heart,then to the capillaries and go out of the mouth.

Circulatory system

The circulatory system is the system of your heart.

When the heart pump the blood out, which is they then go to the arteries, they are the blood that have oxygen (O₂).

When the blood already go into your lungs and your muscles, now they come back into the vein which is that all the blood cells now have no more oxygen.

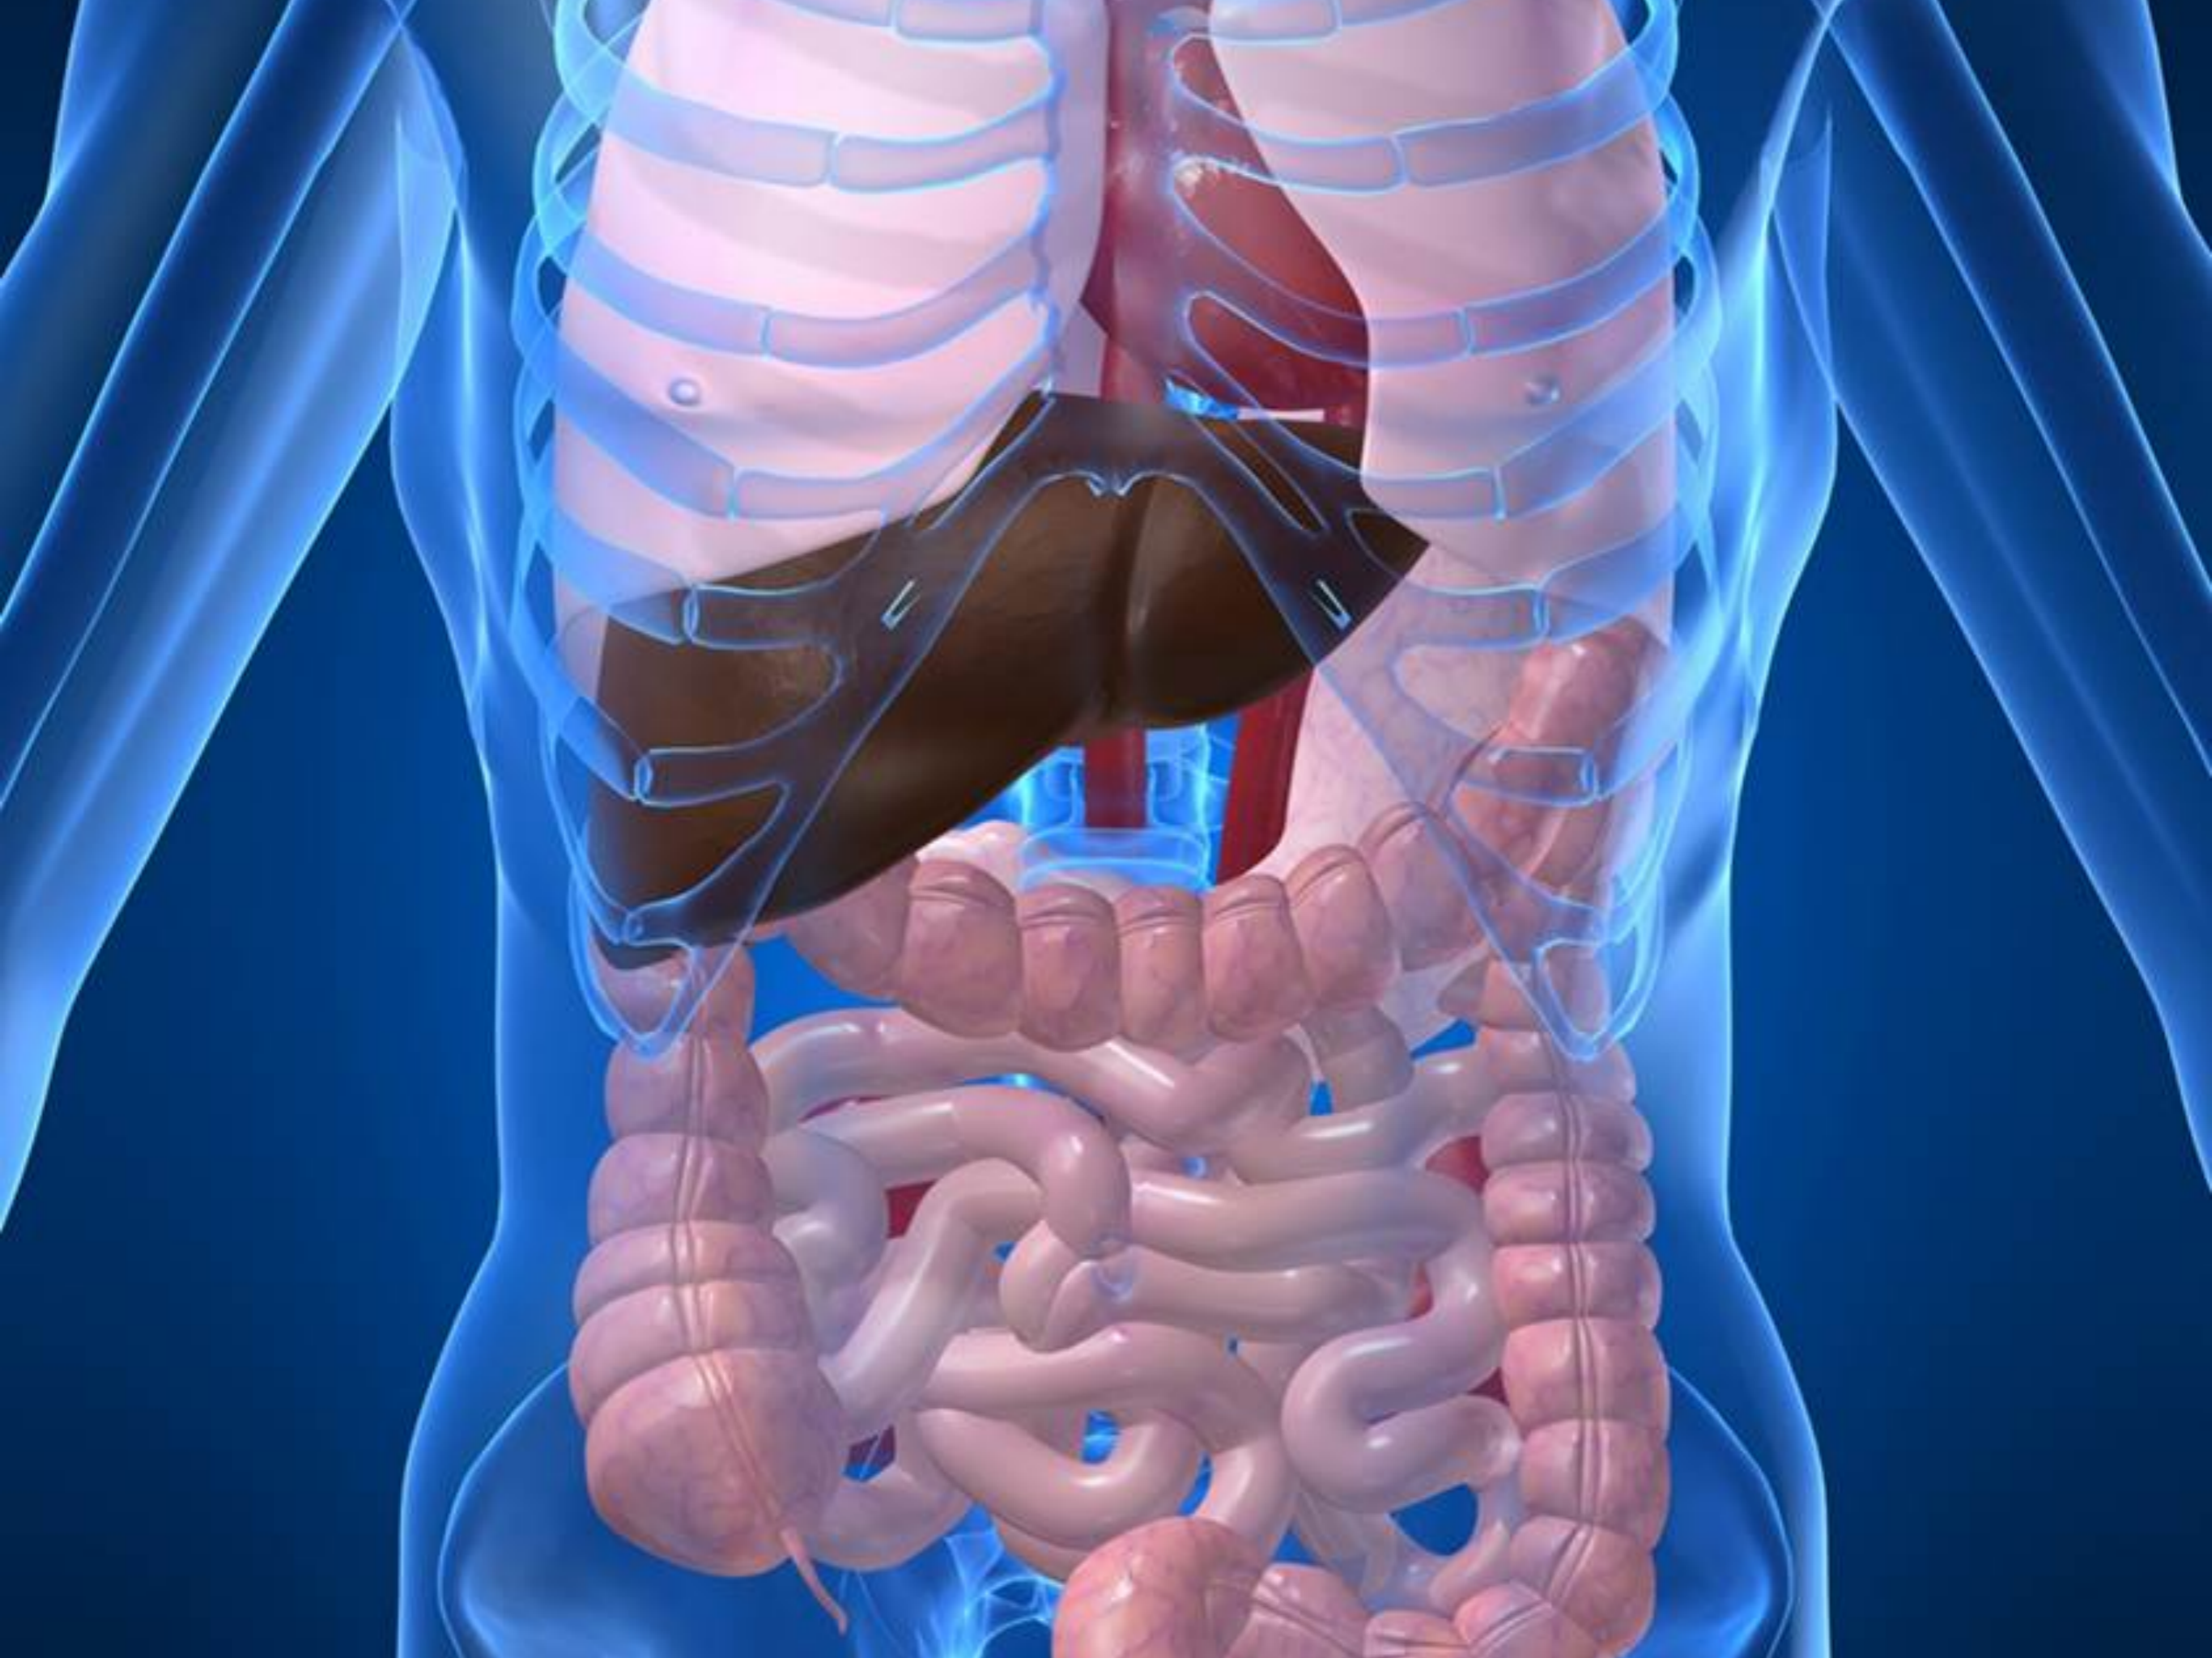

Digestive system

When you eat in some thing in the food the food first go into the esophagus and then to your stomach.

In the stomach the stomach squeeze the food and make it into smaller pieces to go into the small intestine.

At the small intestine the blood cells collect all the nutrients they can find. And finally to the large intestine they kind of just go through the food and see if there is any more nutrients to get and then to the last part anus, that mean the things you don't need go out of your body.

The End

Thank you for watching.
